

Eudrate®

Urea 10% Cream

Presentation

Eudrate® Cream: Each gram cream contains Urea BP 100 mg.

Description

Urea has a therapeutic effect in chronic dry skin conditions through its hydrating, keratolytic and anti-pruritic properties.

Indications and Uses

Urea cream is indicated for the topical treatment of ichthyosis and hyperkeratotic skin conditions associated with eczema and other chronic dry skin conditions.

Dosage and Administration

Urea cream is applied topically. Wash affected areas well, rinse off all traces of soap, dry and apply sparingly twice daily.

Side-effects

May produce local irritations (including erythema, burning or pruritus) and oedema when applied to sensitive, moist or fissured skin.

Precautions

Avoid application to moist or broken skin.

Use in Pregnancy and Lactation

Pregnancy: Category B. There are no well-controlled studies in pregnant women.

Nursing Mothers: It is not known whether Urea is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Urea cream is administered to a lactating mother.

Contraindications

Individuals who have hypersensitivity to any of its components.

Drug Interactions

Urea may increase the penetration through the skin barrier of other topically applied medicaments.

Overdosage

Topical applications of excessive amounts of Urea might cause skin irritation. Ingestion of a large amount of Urea would be expected to result in gastrointestinal irritation (nausea and vomiting). Symptomatic and supportive care should be given.

Commercial Pack

Eudrate® Cream: Each tube contains 15 gm cream.
